

## Retinal Photography

Retinal photography is highly recommended as part of your routine eye exam. It is a digital photo of the retina and optic nerve that is viewed on a computer screen by the doctor and the patient.

This method of examining and documenting the retina promotes earlier diagnosis of abnormal conditions, which could allow us to prevent permanent vision loss. **The imaging is especially important if you have been diagnosed with diabetes.** An additional benefit of retinal imaging is that we store the picture permanently and compare them against any changes in the future.

We are very excited about the results of this technology and recommend retinal imaging as an additional optional test in your eye exam. *The fee is only \$35*, but it is not covered by insurance plans.

Please let us know your preference by checking one box below:

- Please perform Digital Retinal Imaging as recommended.
- I do not wish to have Digital Retinal Imaging performed.
